BTITLE: Homotransplantation of frozen and lyophilized bones in orthopedics and traumatology

SOURCE: Ref. zh. Biologiya, Part II, Abs. 9M166

REF SOURCE: Tr. I Vses. s"yezda travmatologo-ortopedov, 1963. M., Meditsina, 1965, 420-422

TOPIC TAGS: homotransplantation, autotransplantation, bone plastic operation, bone transplant, lyophilization

ABSTRACT: A study was made on the homotransplantation of bones, preserved at +4°, -8°, -25°, -183° and by lyophilization, on the basis of experiments carried out 3-6 months earlier on rabbits and dogs (391) and of boneplastic operations in 79 patients. Homotransplants of preserved bones had good osteogenic properties when the bone socket was carefully prepared, when a close contact was made with the socket, and when the extremity operated on was given a long rest. Unfavorable results (18.9%) were observed in patients on whom

Abstract : Considered is the question concerning the possibility of conjoint polarographic determination of elements having coinciding reduction potentials, from the standpoint of enhanced specificity by means of masking of one of the ions being reduced. Use is made of masking of the Sn(4+) ion, for the purpose of direct polarographic determination of the latter and of Pb on their conjoint presence in

solutions containing large amounts of Zn. Pb content is determined after suppression of the diffusion current of Sn, and the content of the latter from the difference in height of polarographic waves obtained before and after masking of Sn(4+). In the presence of large amounts of Zn (50-200 g/liter) and with a Sn content from 0.005 to 1 g/liter, the diffusion current of Sn is fully suppressed with a 0.05-1% content of citrate ion and pH 1.5-3.5. Under such conditions Zn is not reduced and height of polarographic wave of Pb is directly proportional to its concentration. In hydrochloric acid solution total height of diffusion waves of Sn(4+) and Pb is equal to the sum of the heights of the waves of these metals, taken separately. Between the concentration and wave height, for both Sn and Pb, there exists a directly proportional correlation.

Title:	Metal filling of a channel in a sand-mold
Periodical:	Lit. Preizv. 1, 15 - 17, Jan-Feb 1954
Abstract:	The basic specific features of metal filling in a sand-mold channel are as follows: 1) During the process of mold-filling the temperature of the mold decreases but its viscosity increases. The filling of the mold is done in a comparatively short time within which no stationary motion may be obtained. 2) Chilling of the metal leads to the appearance of solid phases which may have already originated during the filling of the mold and this is the reason for discontinuation of motion lasting till the completion of filling. The ability of the metal to fill the mold is usually defined as its flowability. Three references. Table, graphs.

TITLE Determination of the Conductance of Fireproof materials in the Vacuum up to 2.200°C. (Opredeleniye elektroprovodnosti ogneupornykh materialov v vakuum do 2.200°C).  
PERIODICAL Zavodskaya Laboratoriya, 1957, Vol. 23, Nr 8, pp. 931-934 (USSR).  
ABSTRACT The paper describes the construction of an apparatus and gives examples of its application. The vacuum device corresponds to 5.10<sup>-5</sup> mm mercury column. The sample is heated by means of two graphite slabs with a recess in the middle part. These slabs consist of rods which are 15 mm in diameter and 250 mm in length. The ends of the rods, 50 mm each, remain round. The working surface of 150 mm length and about 14 mm width is planed off to a thickness of 1,5 - 2,0 mm. Moreover a recess of 40 mm length is made in the middle. The lower slab which is placed inversely toward the upper one is in its central part 12 - 13 mm distant from the upper plate and outside the recess (on the edge) about 20 - 23 mm. This fact permits to expose the sample placed in the center to higher temperatures, whereas the edges of the device remain at lower temperatures. The round ends of the rods which in the middle form the slabs are on the sides (left and right) introduced between the massive graphite clamps which are tightened by steel screws. One of the clamps receives a stable connection to the source of current by a copper rod, the other one, however, receives an elastic type of

connection because of the linear expansion due to the effect of heat. The device is moreover provided with tantalum sheet screens because of radiation of heat to the outside, which are connected among each other and represent a supporting basis for the device. The sample is fixed in the center of the device between two molybdenum electrodes, one of the electrodes being fastened stably and the other one possessing a spring connection. Examples for the application of this device are given and characteristic individual cases with regard to the sample materials are described. (3 illustrations).

TITLE: An Apparatus for Determining the Thermal Expansion Coefficient of Refractories (Pribor dlya opredeleniya koefitsiyenta termicheskogo rasshireniya ogneupornykh materialov)

PERIODICAL: Zavodskaya Laboratoriya, 1958, Vol 24, Nr 10, pp 1282-1283 (USSR)

ABSTRACT: In a number of cases the investigations of mechanical and thermal properties of refractories must be carried out at high temperatures (about 2000°). In view of the fact that differential methods use the application of standards for determining the thermal expansion coefficient  $\alpha$ , and that on this occasion also an additional pressure on the sample may occur, the present construction of the apparatus is based on an absolute method. From the diagram and the description given it may be seen that a horizontal microscope of the type MG-1 (provided with dispersion lenses to increase the focal distance) is used as comparator. The measurements were carried out at a temperature of 850-900° within ranges of 100° each. The maximum absolute error of the method described is  $\pm 0,07\%$ . The values of the thermal expansion coefficient of MgO calculated according to the

1. Synthesis of N-Acetyl- and N,N-Diethyl-2,3-diisothiuronium  
Propyl Amine (1. Sintez N-atsetil- i N,N-dietil-2,3-diizo-  
tiuroniypropilamina)

PERIODICAL: Zhurnal obshchey khimii, 1959, Vol 29, Nr 5, pp 1703-1707  
(USSR)

ABSTRACT: Two new S-derivatives of thiourea were produced: dibromide  
of bromine hydrate of N,N-diethyl-2,3-diisothiuronium propyl  
amine and dibromide of N-acetyl-2,3-diisothiuronium propyl  
amine. The course of the synthesis and the values of the  
elementary analysis are given. The synthesis was controlled  
by paper chromatography; furthermore, it was repeated with  
marked atoms ( $\beta^{35}$ ). The reaction between 2,3-dibromopropyl  
amine and thiourea in butanol solution at 80° does not lead  
to the formation of dibromide of the bromine hydrate of  
2,3-diisothiuronium propyl amine. Bromide of the bromine  
hydrate of 2-amino-5-isothiuronium methyl thiazoline is  
probably formed in this connection. There are 1 table and

Kostochkin, O. I.

TITLE: Delayed-neutron yields in  $\text{Pu}^{239}$  and  $\text{Th}^{232}$  fissions induced  
by 14.5-Mev neutrons

PERIODICAL: Atomnaya energiya, v. 11, no. 6, 1961, 539 - 540

TEXT: From theoretical considerations and analyses of experimental data  
a slight decrease in delayed-neutron yields is expected with increasing  
excitation energy. So far it has only been measured for 14.5 Mev  
thermal fission neutrons from  $\text{U}^{235}$ . The authors measured the delayed-  
neutron yield of 14.5-Mev neutron-induced  $\text{Pu}^{239}$  fission and, for compari-  
son, that of  $\text{Th}^{232}$  fission. It was determined as the ratio between number  
of fission events and the number of delayed neutrons produced per second  
in the sample of fissile matter. The Pu or Th sample was cadmium coated  
and bombarded with 14.5-Mev neutrons from  $\text{T}(\text{d},\text{n})\text{He}^4$  reactions, with a  
target just behind it being irradiated simultaneously. The steel backing  
of the target was one electrode of the ionization chamber. To measure

Delayed-neutron yields in...

the number of delayed neutrons emitted, about 0.2 sec; after irradiation had ceased the sample was dipped into a neutron detector 1.5 m from the neutron source. The detector consisted of 17 boron counters of the CHM-5A (SNM-5A) type contained in a paraffin block. The end of neutron bombardment which coincided with removal of the sample was established cinemato graphically with an accuracy of 0.02 sec. As neutron counting started 0.2 sec after the end of bombardment, this caused a loss in neutrons with a delay of 0.16 sec. Special measurements were made to determine this error, which was not above the experimental level. The total number of delayed neutrons could thus be determined by extrapolating the neutron number - versus - time curve to the instant when bombardment ceased. The following results were found: total delayed-neutron yield per decay event:  $0.0130 \pm 0.0015$  for  $\text{Pu}^{239}$ , and  $0.075 \pm 0.007$  for  $\text{Th}^{232}$ . The  $\text{Pu}^{239}$  yield is twice as high as when fission is induced by thermal or fission neutrons. This result is explained by assuming that neutron emission probability increases with increasing excitation energy. There are 1 figure and 4 references: 3 Soviet and 1 non-Soviet. The two references to English-language publications read as follows: G. Keepin et al., Phys. Rev. 107, 1044 (1957); J. Nucl. Energy, 6, 1 (1957); K. Sun et al., Phys. Rev. 79, 3, 1950.

TITLE: The kinetic energy of fragments from the fission of  $U^{238}$  by  
14.5-Mev neutronsPERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 42,  
no. 6, 1962, 1475 - 1477

TEXT: The total kinetic energy of fragment pairs from the fission of  $U^{238}$  by 14.5 Mev neutrons was investigated with the help of a double ionization chamber for mass ratios 1, 1.1, 1.2, 1.3, 1.43, and 1.56 of the pairs. The impulse coming from the fragment pairs was amplified and fed to the vertical and horizontal plates of a cathode ray oscilloscope. This made it possible to determine the energy ratios and thence also the mass ratios ( $E_1/E_2 = M_2/M_1$ ).  $3 \cdot 10^6$  fission events were recorded. The most probable total kinetic energy as a function of the mass of the heavy fragment was obtained from the maxima of the spectra of the total kinetic energy for different mass ratios. These curves are very similar to those

The kinetic energy of fragments...

from the fission of  $U^{233}$ ,  $U^{235}$ , and  $Pu^{239}$  by thermal neutrons. The difference between the maximum of this kinetic energy and the kinetic energy on symmetric fission is  $15 \pm 2$  Mev, which is less than the corresponding difference for the fission of  $U^{233}$ ,  $U^{235}$ , and  $Pu^{239}$  by thermal neutrons and the spontaneous fission of  $Cf^{252}$ . Thus the total kinetic energy of the fission fragments appears to increase with increasing energy of the incident particles. There are 4 figures.

Kovalenko, S. S., Petrzhak, K. A., Adamov, V. M.

TITLE:

The dependence of the total kinetic energy of fission  
fragments on the energy of the bombarding neutrons

PERIODICAL: Atomnaya energiya, v. 13, no. 5, 1962, 474-475

TEXT: K. A. Petrzhak has found (Zh. eksperim. i teor. fiz., 42, no. 6, 1962)\* that in symmetric  $U^{238}$  fission by 14.5-Mev neutrons the total kinetic energy of the fragments is by  $15 \pm 2$  Mev lower than when a fragment mass ratio of 1.3 is assumed. If this result is compared with results obtained by other authors for thermal fission of  $U^{235}$  and  $Pu^{239}$  it can be concluded that the fragment kinetic energy  $E_k$  grows with  $E_n$  in the

region of symmetric fission. In order to verify this conclusion  $E_k$  was measured with  $U^{235}$  fission induced by thermal and 14.5-Mev neutrons. The results (Figure) agree well with those of other authors except in the symmetry region, where the total fragment energy was found to be smaller by 5-7 Mev than that found by Milton and Fraser (Phys. Rev. Lett., Card 1/3 \* 5/056/2/042/006/009/047)

The dependence of the total kinetic ...

S/089/62/013/005/006/012  
B102/B104

7, 67, 1961). For symmetric fission the fragment kinetic energy was by 25+5 Mev higher for 14.5-Mev neutrons than for thermal ones. The relation between the changes in symmetric fragment yield and in total kinetic energy agrees with the assumption that symmetric fission occurs below the Coulomb barrier. For symmetric fission the relation  $E_1 = E_2 - 10.5$  Mev was found to hold;  $E_1$  is the fragment excitation energy for 14.5-Mev neutrons,  $E_2$  that for thermal neutrons. These results indicate that symmetric and asymmetric fissions are two different kinds of fission. There is 1 figure.

TITLE: Probability ratio of the triple splitting of U sup 235 and  
U sup 238 by a neutron of various energies

SOURCE: Atomnaya energiya, v. 16, no. 2, 1964, 144-145

TOPIC TAGS: triple splitting, probability, U sup 235, U sup 238,  
thermal neutron, fast neutron, heavy water

ABSTRACT: The authors have investigated the probability of triple splitting of U<sup>235</sup> and U<sup>238</sup> by thermal neutrons and by neutrons of 2.5 and 14 Mev energy. The thermal neutrons were obtained by slowing down neutrons of 2.5 Mev in paraffin, and the fast neutrons were obtained from the reactions D( $\bar{n}$ ,n)He<sup>3</sup> for 2.5 and T( $d,n$ )He<sup>4</sup> for 14 Mev respectively. The results show that the probability of a triple splitting does not change (within experimental errors of about 10%) with neutron energy. This is at variance with the results of N. A.

TITLE: Neutrons and gamma-quanta at spontaneous ternary fission of  $Cm^{244}$ 

SOURCE: Yadernaya fizika, v. 5, no. 1, 1967, 42-48

TOPIC TAGS: nuclear fission, fission product, prompt neutron, gamma quantum, ALPHA  
PARTICLE, Cm244, 15070128.ABSTRACT: An investigation was made of the dependence of the average number of prompt neutrons ( $\bar{v}_{tr}$ ) and gamma-quanta ( $\bar{n}_{tr}$ ) on the energy of alpha-particles and the interrelationship of energy distribution of alpha-particles and gamma-quanta at a spontaneous ternary fission of  $Cm^{244}$ . The fission fragments were recorded by a small ionization chamber; the alpha particles with a CsJ(Tl) crystal; the neutrons with a stilbene crystal; and the gamma quanta with NaJ(Tl) crystal. An electronic device recorded simultaneously the number of binary coincidences of neutrons (gamma-quanta) and fragments ( $N_{n(\gamma)}$ -frag); the number of binary coincidences of alpha-particles and fragments ( $N_{\alpha}$ -frag); and the number of ternary coincidences of alpha-particles, neutrons (gamma-quanta), and fragment ( $N_{\alpha-n(\gamma)}$ -frag). Preliminary measurements of the dependence of  $v_{tr}$  and  $\bar{n}_{tr}$  on the energy of alpha particles were carried out with the same target. The determined ratios for average numbers of prompt neutrons and gamma-quanta for ternary and binary spontaneous fission of  $Cm^{244}$  were

Card 1/2

UDC: none

ACC NR: A7006225

$v_{tr}/\bar{v} = 0.58 \pm 0.07$  and  $\bar{n}_{tr}/\bar{n} = 0.88 \pm 0.09$ , respectively. An investigation of the dependence of  $v_{tr}$  and  $\bar{n}_{tr}$  on the alpha-particle energy showed that when the energy of the alpha-particle changes from 15 to 25 Mev,  $\bar{v}_{tr}$  decreases from 1.95 to 1.16, while  $\bar{n}_{tr}$  remains constant. This indicates that the ternary fission mechanism is two-staged. Correlated energy distributions of ternary fission of gamma-quanta and alpha-particles were obtained. An analysis showed that the gamma-quanta energy distributions do not depend significantly on the alpha-particle energy. The binary and ternary gamma-quanta spectra were also identical. It follows that no significant gamma-radiation directly connected with the alpha-particle emission is emitted in the ternary fission. The authors thank A. S. Krivokhatkiy, B. M. Aleksandrov, and N. A. Malyshev for the  $Cm^{244}$  targets. Orig. art. has: 6 figures. [WA-95]

TITLE: A Transistorized Call Signal Device (Signal'no-vyzyvnoye ustroystvo na poluprovodnikovykh triodakh)

PERIODICAL: Vestnik svyazi, 1959, Nr 4, pp 10 - 11 (USSR)

ABSTRACT: The author presents the circuit diagram and the characteristics of a transistorized buzzer and magneto device, which replaces the mechanical contact devices used in rural telephone systems with a low number of subscribers. This device was developed by the Nauchno-issledovatel'skiy institut gorodskoy i sel'skoy telefonnoy svyazi (Scientific Research Institute for City and Rural Telephone Communications) of the USSR Ministry of Communications. The transistorized buzzer is an LC-generator with inductive feedback, built with one P3 or P4 transistor. Figure 1 shows the circuit diagram of this device. The resonance circuit is tuned to 450 cycles and is included in the collector circuit of the transistor. The device is fed from a 24 v battery, and its output is approximately 80 - 100 mva. The magneto device consists of an oscillator stage with one P3

Card. 1/2

A Transistorized Call Signal Device

transistor and a push-pull amplifier stage with two P3 transistors. Figure 2 shows the circuit diagram of the transistorized magnetic device. The oscillation frequency is 25 cycles. The device provides for the simultaneous ringing of up to three telephone bells. Both devices are housed in a unit shown in Figure 4; The dimensions of the housing are 250 x 150 x 100 mm. There are 2 circuit diagrams and 1 photograph.

TITLE: Effect of ACTH on restoration of myoneural connections under conditions of reparative regeneration

SOURCE: Byulleten' eksperimental'noy biologii i meditsiny, v. 60, no. 7, 1965, 111-115

TOPIC TAGS: hormone, endocrinology, rabbit, nervous system

ABSTRACT: The effect of small doses of ACTH on the restoration of myoneural synapses in a trauma area was studied in male rabbits weighing 600-600 grams. The musculus tibialis anterior or the posterior extremities of the animals was used. The traumas inflicted on the animals were in the form of small apertures, five millimeters in diameter, in the center of the extremity muscles. The edges of the lesions were sutured. One group of the animals was given ACTH beginning with the first day after the experiments were begun. Small doses were applied in order not to disturb protein equilibrium. The second, a control group, received physiological solution alone. The animals were sacrificed at different periods after surgery. Sections of the extremity

muscles were fixed in a 12% solution of formaldehyde, while the motor nerve terminals were impregnated with silver. Microscopic examinations of all sections were made. It was found that the rabbits which were systematically given small doses of ACTH developed a large number of laminae in the regenerated organs by the 30th day after the beginning of the experiment, and that these were more differentiated than the newly formed motor plaques in the control animals. The specificity of the ACTH effect on the regeneration process cannot therefore be excluded. This paper was presented by V. G. Baranov. Active Member AMN SSSR. Orig. art. has: 3 figures and 1 table. TITLE: Spectral Analysis of Steels on the Modernized Apparatus FES-1  
(Spektral'nyj analiz stalej na modernizirovannom pribore FES-1)

PERIODICAL: Zavodskaya Laboratoriya, 1958, Vol. 24, Nr 6, pp 703-708 (USSR)

ABSTRACT: Photometrical reproducibility was determined, and in this connection it was found that the average arithmetical error on the sensitivity scale of 1:1 amounted to  $\pm 0.5\%$  and with 5:1 to  $\pm 0.15\%$ . Measurements of the intensity of the line of iron 5227 "R obtained from an Armon iron sample showed that on the scale 1:1 a reproducibility of  $\pm 1.1\%$  is obtained with a 4.5 ampere current, and that at 5:1 it amounts to  $\pm 0.62\%$ . It was observed that a distance between electrodes of 1.5 mm warrants accurate reading and good reproducibility; a base electrode of copper was used on this occasion. For the purpose of working out the method of analysis the etalons of the UIM, of the TsNIIChM, and of the plants "Elektrostal'", "Serp i molot" and "Dneproproststal'" were used. The spectral line, measuring accuracy, and reproducibility in connection with the analysis are mentioned. Carbon-containing low- and medium-alloyed steels were analyzed, and data concerning the

Card 1/2

Spectral Analysis of Steels on the Modernized Apparatus  
FES-1

determination of silicon, molybdenum, titanium, vanadium, chromium, manganese, tungsten, and nickel are given, as also data for the high-speed steels P 9 and P 18 and the stainless steel EYALT. The influence exercised by chemical composition upon the intensity of the not separated light was investigated in binary alloys Fe-Cr, Fe-W, Fe-Ni, and Fe-Si. The results obtained are given in form of graphs; it was found that in the case of Fe-W and Fe-Cr samples the intensity of light increases with an increase of tungsten and chromium concentration respectively, whereas the contrary is the case with Fe-Ni and Fe-Si systems. On the strength of these findings it is assumed that for the purpose of stabilizing light intensity the corresponding metal can be used, as e.g. nickel as electrode support in analyses of the Fe-W and Fe-Cr systems. There are 7 figures and 1 table.

TITLE: Experience Made With the Photoelectric Apparatus АФС-10 (DFS-10)

PERIODICAL: Zavodskaya laboratoriya, 1960, Vol. 26, No. 10,  
pp. 1155-1158

TEXT: The authors have been working for one year with the photoelectric spectral apparatus АФС-10 (DFS-10) which had been described previously (Ref. 1). They checked the reproducibility of recording of electric signals and of light. Non-screened light sources (arc and spark) deteriorate the reproducibility of results considerably if these sources are 4-5 m distant from the apparatus. The shock absorption of the instrument was good since the tensile-testing machines operating in the neighborhood did not effect any shifts of exit slits with respect to the spectrum. Also the fluctuations of air moisture between 25 and 70% had no detrimental effect. Only 85-87% of relative air moisture effected a rapid change in readings. Temperature fluctuations between 17 and 29°C in the room

Card 1/3

Experience Made With the Photoelectric  
Apparatus  $\Delta\Phi S-10$  (DFS-10)

S/032/60/026/010/024/035  
B016/B054

did not influence the reproducibility of results although the carriages were displaced noticeably (Fig. 1). Therefore, a steady temperature should be maintained in the room. As examples for metal analyses, the authors describe the investigation of crude iron, plain steels, medium-alloyed steels, stainless steel of the type 1X18H9T (1Kh18N9T), and high-speed steels of the types P9 (R9) and P18 (R18). Figs. 2-8 show calibration diagrams for the determination of single alloy elements. The examples given and the experience made with the instrument justify the statement that the instrument DFS-10 guarantees a rapid and accurate analysis of crude iron and steel, including some complicated steel alloys. At present, the apparatus is being used for series analyses in factories. The values given in the paper for the errors of reproducibility were confirmed by analyses of factory specimens. A single analysis of the specimen for six elements takes 2.5 min. A repetition of the analysis takes the same time. The absolute sensitivity of analysis on the instrument mentioned does not deviate noticeably from that of photographic methods. The authors recommend, however, an improvement and simplification of the fitting and design of the instrument. There are 8 figures and 4 Soviet references.

TEXT:	The investigation is devoted to the limiting heat loads that can be withstood by a helium condensation pump for a magnetic trap, and to a method for reliable heat shielding with maintenance of a sufficiently large evacuation rate. The maximum heat loads are determined for surfaces cooled with liquid helium, and it is concluded that a helium-cooled surface can serve as a pump for evacuation of hydrogen only if the rate of heat supply to this surface is much less than $2 \text{ to } 5 \times 10^{14}$ watt/sq. cm. The possible shielding of a helium condensation pump against excessive heat release into the volume of a heated plasma while still maintaining a sufficient pumping rate was investigated by means of a model, the Card 1/2

construction of which is described in detail. It is concluded that a helium condensation pump can be reliably projected against appreciable radiation and is thus well suited for pumping of magnetic trap. A preliminary project of magnetic trap with helium condensation pump and with coils cooled with liquid hydrogen is described. There are two figures. The only foreign work referred to is an article by Varneri and Carmichael (ref. 1, J. Appl. Phys., 28, 913 (1957)).

TITLE: The investigation of the possibility of using a helium condensation pump for evacuation of magnetic traps

PERIODICAL: Zhurnal tehnicheskoy fiziki, v. 33, no. 1, 1963, 100 - 104

TEXT: This report deals with the extreme thermal loads that arise in a helium condensation pump, operating under radiation condition at  $\sim 3^{\circ}$ K, and with how to combine sufficiently effective thermal screening of the source with a sufficiently high pumping velocity. The experiments were carried out in a vacuum chamber enclosing small metallic containers of liquid helium. A surface cooled by liquid helium can evacuate hydrogen only if the heat added to this surface is considerably less than  $q_{crit} = (3 \text{ to } 5) \cdot 10^{-4} \text{ w/cm}^2$ .

At the critical heat load the temperature of the walls of the container increases by jumps. The helium condensation pump constructed with a view to studying the possibility of screening such a pump against a large release of heat in the region of the heated plasma proved to be suitable for the evacuation of magnetic traps. It consists essentially of a cylindrical

tank containing several annular screens filled with liquid helium or hydrogen. It is protected by a copper screen, cooled by liquid nitrogen from the radiation of the walls of the vacuum chamber and by a water screen and a nitrogen screen from the radiation in the working volume. A helium condensation pump can be effectively protected against a rather intense radiation. The radiation transmissivity coefficient  $\eta$  can be brought down even below  $3.5 \cdot 10^{-5}$  by a careful preparation of the "nitrogen' screen". In the present model a pump velocity of 1.25 l/sec nitrogen or 4.68 l/sec hydrogen is attained per  $\text{cm}^2$  of the inner surface of the water screen. This is about 1/g of the critical pump velocity. For more critical heat load, a helium condensation pump with continuous liquid current and simultaneous evacuation of the helium vapor should be designed. Preliminary experiments show promising results. There are 3 figures and 1 table.

TITLE: Derivation of the photoproduction amplitude from the dispersion relations.

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 44,  
no. 1, 1963, 272-83

TEXT: Expressions for the low-energy photoproduction amplitudes of pions on nucleons are derived when nucleon recoil is taken into account and the possible influence of the unobservable region is considered. Only the S- and P-waves are taken, those being obtained from the one-dimensional dispersion relations by the usual integral method (which yields the integral amplitude) and by a differential method based on an expansion of the amplitude near the threshold of the momentum transferred (that yields the differential amplitudes). The latter method offers various advantages over the integral method. The formulas are simpler and the contribution of the unobservable region is not explicitly contained in them. In the

integral method, because of the narrow resonance, this contribution is very small below the resonance and very large above it; it is then comparable with the total contribution of the dispersion integral. A continuation into the unobservable region by way of a finite number of Legendre polynomials does not involve any notable efforts in the partial amplitudes if the energy is below resonance, but above it the error increases with the energy. At 450 Mev, however, it is not higher than 1-2% for the contributions of the dispersion integrals in the S-wave amplitude and 10-20% in the P-wave amplitudes. The error arising in the differential method due to setting equal zero of the higher partial waves is ~1% for the dispersion integral contributions in the S-wave amplitudes and ~10% in the p-wave amplitudes. If nucleon recoil is ignored the differential and the integral methods yield the same results. If it is taken into account the results are very similar at low energies. The agreement between the theoretical results and experimental data is rather poor; for further investigations it is suggested that  $\pi\pi$ -interaction be taken into account. There are 5 figures. TITLE: Ionization of fast hydrogen atoms in strong magnetic fields			
SOURCE: AN UkrSSR. Fiziko-tehnicheskiy institut. Doklady, no. 052/P-011, 1964. Ionizatsiya bystrykh atomov vodoroza v sil'nom magniton pole, 1-6			
TOPIC TAGS: supersonic flow, gas ionization, strong magnetic field, fast particle			
ABSTRACT: The ionization of fast (30 kev) hydrogen atoms moving through a strong magnetic field was measured. The magnetic field, reaching a maximum of 60 kg, was produced by a multi-turn solenoid having a good field uniformity. The neutral beam was obtained through charge exchange of the ions passing through a supersonic gas flow. A schematic diagram shows the set of electrodes used in determining ions and electrons. The neutral beam current (about $10^{-4}$ amp) was obtained by using a sensitive calorimeter calibrated by an ion beam. Typical ion and neutral currents and magnetic field oscillograms are shown. Such data was used to obtain the graph of the fraction of ionized species as a function of the magnetic field (figure 1). This result and other
